

# End of Sprint Process

## Relocated documentation

This documentation needs a new home along with [Version Control](#). The two can probably be merged with some thought.

# End of Sprint Process

The developers should follow this process for ending a sprint:

1. Soft Freeze by end of Wednesday before sprint end
2. First thing Thursday developers meet to game plan for sprint end demo
  - a. Discuss who will demo which stories with what content
  - b. Determine which stories to abandon
  - c. Swarm on stories still needing work
3. Dry-run demo before leaving on Friday

# Pushing to mallorn

Not ideal but this is what I've been doing - Chris

```
login as root on pine.dlib.indiana.edu
cd
/srv/atlassian/bamboo/bamboo-4.3-data/xml-data/build-dir/VOV-HYDRANT-DEPLO
YLANCELOT
rvm use ruby-2.1.4
export SCM_BRANCH=develop
export RAILS_ENV=development
export AVALON_REINDEX=true #might not actually care what's set here, but
that it's there.
HOSTS=mallorn.dlib.indiana.edu cap deploy
```

# Wiping content

This shouldn't be run at ever end of sprint, but when we get close to testing, this may be needed.

Log into mallorn as the avalon user.

```
cd /var/www/avalon/current
bundle exec script/rails c
ActiveFedora::Base.delete_all
Bookmark.delete_all
#ActiveFedora::Base.destroy_all doesn't work as well.

#Clear solr content
curl http://localhost:8983/solr/avalon/update?commit=true -H "Content-Type:
text/xml" --data-binary '<delete><query>*:*</query></delete>'

#Login as root, Delete files
rm -rf /var/avalon/rtmp_streams/*
rm -rf /var/avalon/hls_streams/*
ln -s /usr/share/avalon-sample-content/hls-streams/*
/var/avalon/hls_streams/
ln -s /usr/share/avalon-sample-content/streaming/*
/var/avalon/rtmp_streams/
```

After the content is cleaned up, [reinstall the sample content](#).
