

DLSearch

DLSearch is a generic implementation of the [Slocum Puzzles](#) webapp. The intent is to provide an end-user interface with basic functionality that can be easily adapted for our most common object types. Currently, it serves the "detail pages" (images and metadata) for simple collections, including [Hoagy](#), [Hohenberger](#), and [U.S. Steel](#).

The source code for DLSearch is in the searchWebapp project under the infrastructure subversion repository. To add/modify collections in DLSearch, edit the XSL files in the WEB-INF directory. SRUDetail.xsl is the main file, which passes off to other files for specific collections.
