

Data Capacitor

IU is creating a large installation of disk-based storage that will be known as the [Data Capacitor](#). It is still being designed, but they claim that:

- it will contain hundreds of Terabytes
- it will support connections via NFS, CIFS, Grid FTP, and others
- there will be some integration with [HPSS](#), hopefully so all data coming in will be able to be archived
- the first version will be operational by late spring '06
