

Avalon 3.0 Release

Release 3.0 of the Avalon Media System is now available. Both Indiana University and Northwestern University will be using this release to set up production environments and we hope other institutions will join us.

Release 3.0 adds the following capabilities:

- provide authorization for item access from your learning management system by integrating Avalon as an LTI tool (Learning Tools Interoperability is a standard used by many course management systems)
- embed Avalon's media player in other web page using embed codes
- configure Avalon to delete, move, or do nothing to your master files after they are transcoded
- track location of master files and derivatives in Fedora
- configure Avalon to assign a permanent URL (e.g., PURL or Handle) when an item is published
- quickly import previously transcoded derivatives
- maintain privacy of dropboxes between collections
- numerous media player bug fixes and improvements
