

OHMS support

Changes were needed in the ohms-viewer in order to get it to work with the avalon's embedded player and oembed.

1. git clone the viewer from [here](#) and follow the instructions on that page to install it locally. I also installed tomcat and php to get it to work.
2. In the ohms viewer, you can make your own standard player by adding the javascript and a php template.
 - a. This is the php file we wrote, to be added to ohms-viewer/tmpl : <https://gist.github.com/lealeelu/8e2da17afe7cd614d9ff>
 - b. and for the javascript, we just copied the one used for youtube in js/viewer_youtube.js and renamed it to js/viewer_oembed.js. This will be the main file that needs to be changed. It controls the playback.
3. Add the new oembed viewer to config/config.ini under players. The line should look like this:
players = other,brightcove,kaltura,youtube,oembed

TODO:

We need to be able to send messages into the iframe to control the player in js/viewer_oembed.js – unfortunately you can't send messages very well that way, so we'll probably need to figure a way out to embed everything within the iframe, leaving the iframe behind. This might require having to change what oembed returns, maybe we could supply parameters to specify non-iframe or iframe.
