Algorithm - Major Processing Steps

1. Contributor Record Creation
 - Check V2 Database for duplicate
 - Query Authority File
 - Create Record and Map from Name Authority Record and/or MARC bib record ([Mapping Document](#))
2. Work Record Creation
 - Identify using work-identification algorithm ([Work Identification Algorithm](#))
 - Check V2 Database for duplicate
 - Query Authority File
 - Create Record and Map from Name/Title Authority Record and MARC bib record ([Mapping Document](#))
3. Container Record Creation
 - Create Record and Map from MARC bib record ([Mapping Document](#))
4. Instantiation Record Creation (for those works created above)
 - Create Record and Map from Work Record and MARC bib record ([Mapping Document](#))
 - Attach to Container Record
5. Container Record Mapping (second pass, to account for instantiations not created)
 - Map from MARC bib record (attach Contributors directly to container) ([Mapping Document](#))

* This text would be taken from |m. This could be disregarded when determining collective title status, *unless* |n and/or |p are present (thus meaning title is *not* collective)

** "Sonatas, violoncello, piano" may be a specific work title *if* composer wrote more than one sonata *but only one for violoncello and piano*. If the composer wrote more than one sonata for violoncello and piano, than this is a collective title. The same is true of concertos, suites, etc. Cannot yet devise a way around this ambiguity in uniform title nomenclature.
